Group Members: Fernandez, Nelsonny
Galendez, Janver
German, Allaine Joy
Palayon, Kim
Paulino, Charies
Group Number: 2
Program and Set: BSEd Science 2C

ACTIVITY

1. Form a group of four. With your group, complete the statement: “The unforgettable experience that I had with bacterial organisms would be when _____. “ Let each one share.
    a. **Fernandez**: I learned how some bacteria can both cause diseases and help our body, like those found in our gut that aid in digestion.
    b. **Galendez**: I learned that bacteria can both cause diseases and strengthen our immune system, showing that they play a dual role in our health.
    c. **German**: I learned that bacteria help in making bread and cheese which we consume.
    d. **Palayon**: I discovered that some bacteria are used to produce medicines like antibiotics.
    e. **Paulino**: I learned that bacteria keep you healthy by absorbing nutrients, breaking down food and preventing the growth of harmful bacteria.

2. List all the responses that you can gather. Then trim down your list by retaining only those words/phrases that are not redundant.
    - Gut bacteria aiding digestion.
    - Bacteria help protect the body by supporting immune defense mechanisms.
    - Bacteria used in bread and cheese production.
    - Bacteria in medicine production.
    - Bacteria act as natural food preservers.

3. Write your final list as the group’s output.
    - Dual role of bacteria in the body.
    - Bacteria can be harmful by causing infections, yet they are also essential for keeping the body healthy.
    - Bacteria in food production (bread and cheese).
    - Bacteria used in pharmaceutical production.
    - Bacteria balance the ecosystem.

ANALYSIS

1. What types of bacterial experiences are prevalent in your list?

The types of bacterial experiences that are prevalent in the list are mostly health related and beneficial roles of bacteria. Many responses focus on how bacteria help the human body, such as aiding in digestion, absorbing nutrients, strengthening the immune system, and preventing the growth of harmful bacteria.

Another common experience is bacteria in food production, particularly in making bread and cheese. Also, bacteria are being used in the production of medicines. It highlights the dual role of bacteria, while some bacteria can cause diseases, many are beneficial and essential for human health and food production. The bacteria are not only harmful organisms but also important contributors to our well-being and daily life.

APPLYING NEWLY CONSTRUCTED IDEAS TO A SIMILAR SITUATION

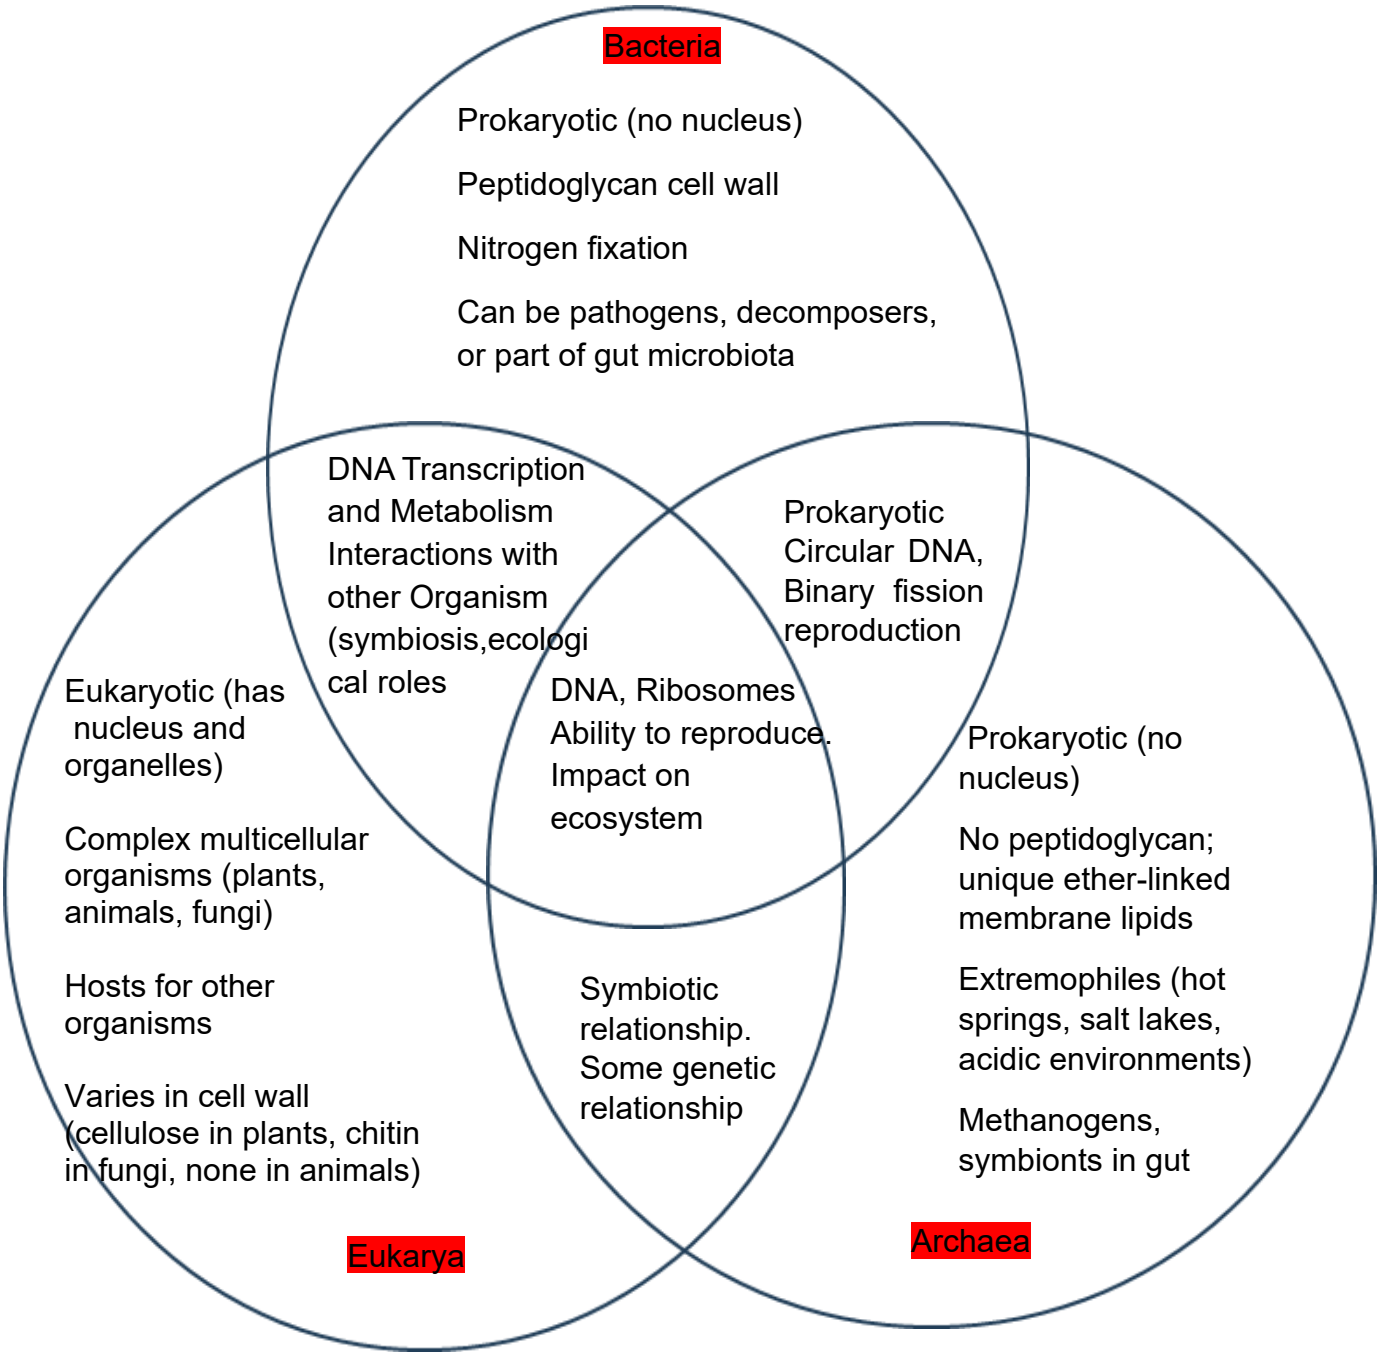

ASSESSMENT

Name: Janver C. Galendez BSED SCI 2C

Instruction: Read and understand the question. Carefully think and construct your thoughts before putting them into writing.

1. Create a Venn diagram that would compare and contrast the three bacterial domains in terms of their general characteristics and their impact on other organisms.

2. Compose an essay that will depict the distinguishing aspects of at least three representatives of bacteria with their occurrence and impact on organisms**.**

Bacteria are tiny living things that can be helpful or harmful to humans and other organisms. Three examples of bacteria are **Escherichia coli (E. coli), Streptococcus pyogenes,** and **Lactobacillus acidophilus.**

Escherichia coli is usually found in the intestines of humans and animals. Most types are harmless and help in digestion, but some types can make people sick, causing diarrhea or stomach pain. This shows that bacteria can be both helpful and dangerous depending on the type.

Streptococcus pyogenes lives on the skin and in the throat. It can cause infections like strep throat or skin problems. If it is not treated, it can lead to more serious health problems. This shows that some bacteria can directly affect our health.

Lactobacillus acidophilus is found in the stomach, intestines, and mouth. It is helpful because it stops bad bacteria from growing and helps keep our body healthy. It is also used in making yogurt and other fermented foods.

In conclusion, these three bacteria show that some bacteria can be good, some can be bad, and some can do both. Learning about them helps us understand how bacteria affect our health and the food we eat.
