

Charles Darwin (1809 - 1882)

Naturalist and Geologist

Charles Robert Darwin was born on February 12, 1809, in Shrewsbury, England, and died on April 19, 1882. He was an English naturalist who studied variation of plants, animals, and fossils during a 5-year voyage around the world in the 19th century. The book of **Origin of Species**, written by Charles Darwin and published on 24 November 1859, is regarded as one of the most important scientific works ever published. It revolutionized biology and our understanding of life on Earth, influencing not only science but also philosophy, religion, and many other fields. Charles Darwin is best known for proposing the **Theory of Evolution by Natural Selection**, in which he suggests that species evolve over time through a process where individuals with advantageous traits are more likely to survive and reproduce. This process leads to the gradual adaptation of species to their environments.

Overall, Darwin's contributions have reshaped human thought, influencing not just science but also philosophy, ethics, and our broader understanding of life and our place in the natural world.
