PEER LESSON PLAN CRITIQUE SHEET

Group observed - GROUP 5

Topic: Plate Tectonics - Different types of Plate Boundaries

1. What ICT Tools were used in the lesson?

- Laptop • TV • Powerpoint • Google forms •

2. Were the ICT Tools appropriate for the science topic and learning Objective Explain your answer - For me Yes, the ICT Tools were appropriate for the science topic and learning objectives. The PPT presentation helped explain the concepts of plate tectonics and plate boundaries through visual aids. The use of laptops allowed students to research information about their assigned plate boundary. The Google forms quiz was also effective because it allowed students to answer questions digitally.

3. How did the lesson promote 21-st century skills such as critical thingking, communication, collaboration or creativity?

- Critical Thingking: students analyzed images and researched information about plate boundaries to understand how tectonic plate movements create landforms and geological events.
- Communication: Students explained their findings and presented their plate boundary models to the class.
- Collaboration: Students worked in groups during activities, creates teamwork.
- Creativity: Students create model that demonstrated the movement of tectonic plates and the landforms formed from these movements

4. What part of the lesson was most effective?

→ For me the most effective part of the lesson was the model-making activity and group presentation. This activity allows students to apply their knowledge by demonstrating plate boundary movements through a physical model. It helped students better visualize how tectonic plates interact and form landforms such as mountains, volcanoes and faults.

5. What suggestion can you give to improve the integration of ICT in the lesson?

- Include animations that shows tectonic plate movements to make the concepts more visual and easier to understand
