Evidence-based Principles of Effective Learning and Teaching

These principles are based on the following assumptions:

- It is a lifelong process to learn.
- People learn through interaction with others, independent learning.
- How and with whom something is learned determines how and what.
- Identifying how others learn best, extending their learning methods, creating learning opportunities, and evaluating student learning are vital.
- Learning and teaching practices are continually improved based on effective learning and teaching principles.
-

These assumptions suggest that the learning-teaching process is multifaceted in terms of what is learned, how it is learned and the roles of participants.

Students develop knowledge about the topics covered in the curriculum. They learn social norms and values from the ways that people behave at school as well as in society. And by reflecting on the actions and processes by which they learn, students develop an understanding of the ways they learn.

Pair 1 – MAYNOPAS & FABIANA

Principle 1 - Effective Learning and teaching is founded on an understanding of the learner.

Understanding the learner involves:

- identifying features of the learner's past and present experience and respecting the influence of these features on the learner's personal development;
- recognizing factors-such as location, gender, ethnicity, ability, disability, and socioeconomic and political circumstances that place the learner within power relationships in the learning context as well as in society; and
- recognizing and supporting each learner's motivation and capacity to challenge and change his or her current circumstances.

Principle 2 - Effective learning and teaching required active construction of meaning.

Learners construct meaning when they:

- challenge their own knowledge and understanding and respond to the challenges of others;
- participate in a variety of formal and informal social and cultural interactions; explore, and develop an openness to, the diversity of knowledge, understanding, values and beliefs;
- take appropriate risks and learn from "mistakes";
- reflect critically on their own and others' knowledge, actions and assumptions including those relating to gender, race and class and
- develop a range of thinking processes including divergent, convergent, lateral, critical and creative thinking.

Pair 2 – MESOLIS & FERNANDEZ

Principle 3 - Effective learning and teaching enhance and is enhanced by a supportive and challenging environment.

A supportive and challenging environment is characterized by:

- a climate that emphasizes care, support and quality relationships based on mutual respect for all involved in the learning-teaching process;

- a climate that values effort, provides achievable but challenging expectations, builds self-esteem and encourages learners to become responsible and independent: and
- effective communication among all learners.
- cooperative planning and implementation of programs for continuity of learning
- equitable access to, and flexible use of, quality human and material resources which are appropriate to the needs of learners; and
- experiences that are sensitive to the needs of learners and encourage timely intervention by a range of professionals.

Principle 4 - Effective learning and teaching is enhanced through worthwhile learning partnerships.

Worthwhile learning partnerships develop in a variety of contexts when:

- learners and teachers seek knowledge together,
- teachers are active learners and learners have the opportunity to teach others;
- learners and teachers communicate their expectations and achievements;
- learners and teachers encourage interaction and respond to the opportunities that arise from them;
- learners and teachers demonstrate their enthusiasm and commitment to learning through their actions and approaches;
- learners and teachers take time to reflect critically and creatively on their practices; and
- learners and teachers review and plan together for a shared purpose.

Pair 3 – MOMO & GALENDEZ

Principle 5 - Effective learning and teaching shapes and responds to social and cultural contexts.

The learning-teaching process shapes and responds to social and cultural contexts when:

- learners develop attitudes, knowledge, skills and processes which enable them to contribute to and react to change within the community;
- all learners have equitable access to and participation in all aspects of the learning-teaching process regardless of location, gender, ethnicity, ability, disability, and socioeconomic circumstances;
- all groups of learners achieve success based on realistic and challenging expectations;
- learners participate as active and informed citizens in Australia's diverse society; and
- individual diversity as well as the perspectives, contributions and experiences of diverse social and cultural groups are included and valued.

ITINERARY 2: LEARNING DIVERSITY AND INDIVIDUAL DIFFERENCES

Learning Journey. At the end of the lesson, you are expected to:

- *discuss the different exceptionalities in learning;*
- *critically analyze the issues, trends, barriers, and challenges pertaining to the development and learning potential of students with a range of exceptionalities; and.*
- *examine and suggest the ethical considerations surrounding the labeling diagnosis and treatment of learners with exceptionalities.*

Learners with Exceptionalities

Our society is enriched by the diversity of its people. Individuals with disabilities can and should contribute to this richness, and inclusion is the way to make it happen.

- Kathie Snow

The way children learn and the amount of knowledge they can absorb can vary considerably, especially for children with special needs. As a society, we must provide the best possible learning environment for all children to reach their potential. Rather than assigning special-needs children only to special education classes, many advocates suggest mainstreaming them into regular classrooms.

Inclusive Education, Mainstreaming and Integration are all concepts associated with the educational placement for learners with disabilities. The very existence of these concepts is proof that educators disagree on them as ideal for placement of learners with disabilities hence, one can conclude that placement of learners with disabilities has remained a controversial issue.

IT'S INCLUSION WHEN

★ everybody plays, learns, and grows—together.

★ each child is included in every activity, routine, and learning opportunity.

★ teachers and caregivers plan activities appropriate for both the developmental abilities and interest level of the children.

★ parents value diversity and the powerful way children learn from each other.

★ each child has opportunities to enjoy typical every-day-little-kid experiences.

Physical, behavioral, and cognitive differences require additional support for people with learning disabilities. The term handicap should not be used interchangeably with disability. Those with disabilities have functional limitations, such as ADHD, that affect their ability to perform. In contrast, someone with a handicap has limitations imposed upon them by society, such as limited access for people in wheelchairs.

Pair 4 – NOOR & GERMAN

Categories of Exceptionalities

Learners who are different from "normal" or "average" learners, needing special needs such related to cognitive abilities, behavior, social functioning, physical and sensory impairments, emotional disturbances and giftedness.

1. **Learning Disabilities**

   Difficulties in acquiring and using listening, speaking, reading, writing, reasoning or mathematical abilities.

2. **Communication Disabilities**

   Interfere with students' abilities to receive and understand information from others, and to express their own ideas or questions.

3. **Intellectual Disabilities**

   Limitations in intellectual functioning and problems, as indicated by difficulties in learning, and problems with adaptive skills (communication, self-care, and social interaction.

4. **Behavior Disorders**

Display of serious and persistent age inappropriate behaviors that result in social conflict, personal unhappiness, and school failure.

1075koolfm.com

Labeling is an important issue with respect to learners with exceptionalities. When students are identified with exceptionalities, stereotyping becomes easy, such as "the deaf student." However, when people come before exceptionalities, stereotyping may not be so automatic, such as "the student with a hearing deficit/loss." Keep in mind two rules with respect to labeling; people come before labels, and avoid making the person equal to the disability.Learners who are different from "normal" or "average" learners need special needs related to cognitive abilities, behavior, social functioning, physical and sensory impairments, emotional disturbances, and giftedness.

Exceptional learners – learners who are different from "normal" or "average" learners, needing special needs such related to cognitive abilities, behavior, social functioning, physical and sensory impairments, emotional disturbances, and giftedness.

- **Mental retardation:** An individual with mental retardation exhibits substantial limitations in their present functioning, such as lower intellectual performance or difficulty in adapting to daily life.
- **Giftedness:** The gifted child possesses high performance capabilities in areas such as intellectual, creative, academic, leadership, or visual and performing arts. Consequently, these children require activities or services not usually provided by schools. Typically, gifted and talented children are highly motivated, read early, and perform well academically.
- **Physical disabilities:** This can include any of a number of disabilities, such as orthopedic impairments (e.g., clubfoot or cerebral palsy) or other health impairments like asthma, hemophilia, or lead poisoning.

- **Visual disabilities:** Blindness and low vision are both visual disabilities. With the help of optical or non-optical devices, environmental modifications, and/or techniques, individuals with low vision can function.
- **Hearing disabilities:** Deafness, hard of hearing, and profoundly hard of hearing are types of hearing impairment. Even with hearing aids, those in the latter two groups cannot rely on audition as a primary method of assessing information. Hearing aids are used to process auditory information in the former classification.

Pair 6 – PAULINO & LABRADOR

- **Learning disabilities:** An educational disability manifests itself in difficulties with arithmetic, reading, writing, spelling, or attention due to a disorder in one or more of the basic psychological processes. It can be caused by brain damage, dyslexia, or perceptual problems. It does not include problems caused by mental retardation, environmental disadvantages, motor, vision, or hearing impairments.

- **Emotional/behavioral disorders:** An inability to learn that cannot be explained by health, intellectual, or sensory factors; an inability to build or maintain satisfactory interpersonal relationships; inappropriate behaviors displayed under normal circumstances; a pervasive mood of sadness or depression; and a tendency to develop physical (sympathetic) symptoms associated with school or personal concerns. Disorders such as schizophrenia, anxiety, and mood disorders are examples.

- **Speech disorders:** Stuttering or rough, hoarse, or nasal-sounding voices prevent those with speech problems from communicating clearly due to language code (rules governing word construction, meaning, grouping, and pragmatics). Coding has to do with language problems. They are either expressive or receptive.

  The receptive language problem prevents students from understanding language code. People with expressive language problems cannot fully communicate thoughts, ideas, or feelings in language code.

- **Autism:** Autism is a disability that affects verbal and nonverbal communication, as well as social interaction. Repetitive behaviors, difficulty adapting to new environments, and unusual responses to sensory stimulation characterize autism before the age of three.

Pair 7 – PUNGAY & LAGTING

Integration and Mainstreaming

> *Learning differences are observable phenomena that can be explained, predicted, and altered in many different ways. The concept of individual differences in learners is considerably more esoteric. Because it looks for explanations in the person of the learner instead of in the interaction between individuals and the educational and social environments in which they have been placed, it often obscures our efforts to address educational problems directly." - B.Bloom*

Integration refers to learners with disabilities being placed in a special class within a regular school and only joining their peers outside of the classroom during activities. Inclusive education, on the other hand, emerged from integration and mainstreaming, under the philosophy of Least Restrictive Environment (LRE). Inclusion describes an environment as close to normal as possible, where learners with disabilities are primarily served in regular education classrooms with support from regular classroom teachers and appropriate aides. Inclusion is considered more advanced and relevant than mainstreaming and integration.

Educational Implications

There are many aspects of a child's life affected by learning disabilities. LD students are often trapped in a vicious cycle of failure. Their learning disabilities inhibit their ability to develop academic skills and abilities, which in turn impedes their ability to learn new things (Stanovich, 2019). These students become increasingly behind as a result of repeated failures.

There are many educational implications for students with learning disabilities:

- During labs and field placements, students may demonstrate a significant discrepancy between their theoretical understanding and their practical achievements.
- It is possible for them to demonstrate well-developed oral communication skills, but significant deficits in written expression.
- It may be difficult for students to keep up with the pace of the class, including taking notes and answering questions.
- During tests, remembering formulas to solve application questions can be challenging if lecture material is not retained.
- Despite listening to lectures and understanding the content, some students may not possess adequate reading skills.

- In turn, reading comprehension and the ability to cope with large amounts of reading can be affected by deficiencies in word recognition, reading speed, and vocabulary.
- The completion of a "hands-on" project may require spatial reasoning, organization, and following a sequence of steps.
- Peers and professors may misunderstand social cues, making it difficult for students to communicate their needs.

Pair 8 – SINGSON & LARGO

Instructional Strategies

The following instructional strategies are recommended:

- Provide students with a variety of study strategies that will reinforce important concepts.
- Analyze test errors and provide feedback.
- Reinforce theoretical concepts with visuals, demonstrations, and practical examples.
- New units of study should begin with an introduction to key concepts and vocabulary.
- Make lectures more structured by providing outlines and advance organizers.
- Prepare a reading list in advance.
- Students should be given time to review and clarify concepts presented in class as well as to ask questions before beginning an assignment.
- Instead of giving long assignments, give several short ones.

Gender Differences

In gender and education research, it has been found that teaching practices are disconnected from the needs of male and female brains.

What is the purpose of contemporary education? Is it aimed at discriminating against either females or males? No, we do not think so. We fail to recognize and meet the specific needs of girls and boys in our schools structurally and functionally today. In the words of one teacher.

I realized decades ago that students learn differently based on their gender, but I did not know enough to help each student reach their full potential. My training taught me that every student is an individual. After learning about boys' and girls' brains, I realized how different those brains are. As a result, I was able to find the missing component. My training allowed me to teach each child based on their individual brain differences. It amazes me now that teachers didn't teach the differences between the learning styles of boys and girls.

Sex and gender

Gender is not inherited or something we are born with, but rather a performance. Gender exaggerates biological differences and carries them into irrelevant domains, such as the expectation that women have red toenails. While we tend to see gender as social and sex as biological, the boundaries between the two are fuzzy and nature and nurture are intertwined. Gender plays a crucial role in social norms and expectations, particularly regarding heterosexual marriage and childrearing. Gender performances that children engage in can influence their adult behavior.

Addressing Gender Equality with Teaching Strategies

Through unintentional, nonverbal actions, teachers may appear to be biased against one gender or another. You can correct this problem by organizing your classroom to make all students feel equal.

1. **Establish rules**

At the beginning of the year, teachers need to establish a set of rules that will promote equality. Making class rules with your students is an excellent way to accomplish this. Ensure that the classroom is a respectful and equal place by asking students to suggest ways to keep it that way.

The teacher can then emphasize that the entire class has endorsed the rules. In addition to class participation rules, it is essential to have rules dealing with respect for students, respect for teachers, and respect for other students.

2. **Have equal academic and behavior expectations for all students**

Changing the seating plan of your class may help you engage students, regardless of their gender. Make sure students who usually sit in the back come to the front, as an example.

Students sitting closest to teachers tend to receive the most interaction from them. The seating order should be changed (if possible) so that all students have a chance to sit near the teacher.

3. **Have equal academic and behavior expectations for all students**

By giving students easier questions in class or solving problems for them, teachers should avoid making things easier for either males or females.

As a result, certain students may be perceived as less intelligent than others. Each student should be expected to meet the same level of expectations from their teacher.

4. **Use group work**

There are often students, male or female, who do not feel comfortable speaking in front of large groups. It is possible, however, that they are more comfortable speaking in small groups. Consider doing some class activities in small groups of three to four to give all students an equal opportunity to participate.

Tips for classroom strategies

Consider the effects of your actions in class after organizing your class to promote equality.

1. Addressing students equally

Students can participate in class by answering teachers' questions. It is important that teachers communicate with both males and females in a balanced manner. Both male and female teachers are more likely to call on male students to speak in class.

2. Provide enough wait time to answer questions

A teacher may ask students to think about their answers for a few minutes before calling on them. Provide students with at least four or five seconds when they appear to be taking their time to answer a question. According to research, students who are given more time to answer are more likely to participate.

3. Use gender neutral language

It is common for English speakers to refer to a group by using male pronouns. Female students can feel left out because of this, however. The use of gender- neutral pronouns by teachers should be encouraged whenever possible. When talking about a group or class in American English, rather than saying "guys," say "everyone."

4. Body language

Talking should always be done in a respectful, listening manner. Make sure you do not interrupt students, look at them, and do not walk away from them. Female students and male students may have different body language, and teachers may not realize it. The teacher can also move between different parts of the classroom while speaking. Student participation is lower when they sit further away from the teacher.

5. Discipline

It is vital for you to be aware of when male students insult female students, and when female students insult male students, when it comes to disrespecting each other. The insults may discourage students from participating in class in the future. Students who insult others should be disciplined immediately. As a result, both genders will feel supported. However, students should receive the same discipline for the same actions, whether male or female.

ITINERARY 3: FLEXIBLE AND DIFFERENTIATED TEACHING AND LEARNING

Learning Journey: At the end of the lesson, you are expected to:

- discuss the relevance of individual differences as applied to the classroom setting;
- distinguish and explain the multiple intelligences and different learning styles; and
- design learning activities for different learning styles.

Individual Differences

"No two persons are born exactly alike; but each differs from the other in natural endowments, one being suited for one occupation and the other for another."

- The Modern Psychologist

Individual differences among students are significant and must be taken into consideration in teaching and learning. These differences include cognitive and affective development, social maturity, ability, motivation, aspirations, learning style, needs, interests, and potential.

Types of Individual Differences:

1. **Physical differences:** Individual differences include shortness or tallness of stature, dark or fair complexions, fatness, thinness, or weakness.
2. **Intelligence differences:** Different individuals have different levels of intelligence. Depending on their intelligence level, we can classify individuals as super-normal (above 120 I.Q.) or idiots (0-50 I.Q.).

3. **Differences in attitudes:** People have different attitudes toward different people, objects, institutions, and authorities.

4. **Differences in achievement:** Through achievement tests, it has been found that individuals differ in their ability to achieve. Learning to read, write, and do mathematics demonstrates these differences.

5. **Differences in motor ability:** There are differences in motor ability. These differences are visible at different ages. Some people can perform mechanical tasks efficiently, while others feel much difficulty in performing these tasks even though they are at the same level.

Pair 12 – BONCALES & DELA CRUZ

6. **Differences on account of sex:** It is important to note that while studies may suggest differences between men and women in certain areas, it is important to avoid generalizations and recognize that individual differences exist within each gender. It is also important to ensure that these differences do not lead to discrimination or limited opportunities for individuals based on their gender.

7. **Racial differences:** Racial differences come in different forms. These differences can be attributed to differences in the environment. A person's mental age can't be calculated based on these average differences between races because this difference is based on their environment.

8. **Emotional differences:** Different people react differently to different situations emotionally. It is common for some people to become irritable and aggressive very quickly. Others are peaceful and do not get angry quickly. One person may be enraged by a particular thing to the point of preparing for the worst crime, like murder, while another may only laugh at it.

9. **Personality differences:** Different personalities have different characteristics. Individuals have been classified into many groups based on their personality differences. Spranger, for example, classified personalities into six categories: (a) Theoretical, (b) Economic, (c) Aesthetic, (d) Social, (e) Political, and (f) Religious. People are classified into three groups:: (a)Introverts, (b) Extroverts, and (c) Ambiverts.

Four major personality types as follows:

a. **Phlegmatic** – those who are unflappable and slow to take action.

Phlegmatic people are known for their desire for interpersonal harmony and close relationships, making them loyal partners and caring parents. They value connections with friends, family, and neighbors, and often make an effort to maintain those relationships. In times of conflict, they tend to avoid it and seek to mediate and restore peace between others.

b. **Sanguine** – those who get excited easily but not strongly and they have short-lived interests.

Those with sanguine personality types tend to be active, optimistic, buoyant, and carefree. High-risk tolerance and a love of adventure make them great adventurers. It is common for sanguine people to seek variety and entertainment in order to avoid boredom. There is no doubt that this trait can sometimes have a negative impact on their romantic relationships and other relationships as well.

c. **Choleric** – these kind of people are impetuous, impulsive and often ambitious and perfectionist.

Cholerics are practical and straightforward, preferring deep conversations with like-minded individuals in their profession. They are not particularly social and would rather be alone than with superficial people.

d. **Melancholic** – they are inclined to reflection.

Melancholic people love traditions, prefer stability over novelty, and cherish their families and friends. They are less likely to marry foreigners or move to another country.

Pair 14 – ARCEJO & DOMINISE

Learning/Thinking Styles

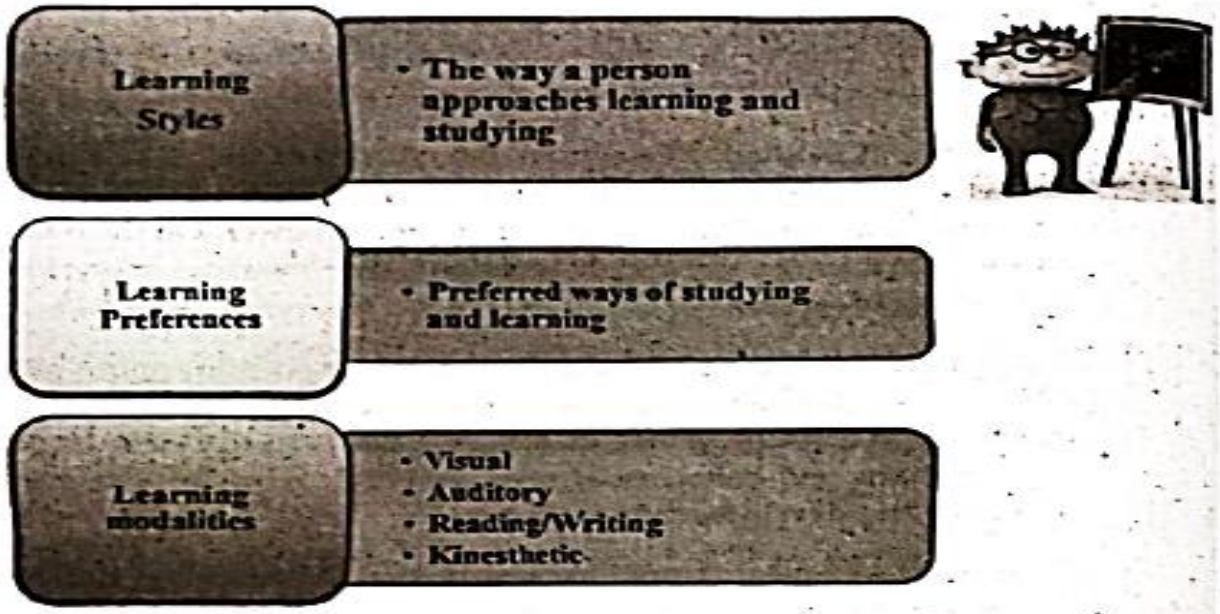

Individuals have different learning styles based on their preferences, patters, and approaches. Understanding one's own learning style can help in comprehending that others may approach the same situation differently.

There are many definitions for learning styles:

1. "Learning styles refer to an individual's natural preferred way of absorbing, processing and remembering new information and skills that persist regardless of teaching methods, culture or subject" (Gold, 2002).

2. According to Reid (1995: viii), learning styles refer to "an individual's natural, habitual and preferred way(s) of absorbing, processing, and retaining new information and skills."

3. "Learning styles are internally-based characteristics of individuals for the intake or understanding of new information" (Kang, 1999:6).

Individual learning styles affect how people learn under different circumstances. Some people learn best through hearing information, while others prefer seeing and writing down information. Learning involves gaining abstract concepts that can be applied to real-life situations, according to Kolb and McLeod (2013).

The VARK learning style uses the three main sensory receivers: Visual, Auditory, Reading and Writing, and Kinesthetic (movement) to determine the dominant learning style. It is sometimes known as VARKT (Visual, Auditory, Reading and Writing, Kinesthetic, and Tactile). It is based on modalities—channels by which human expression can take place and is composed of a combination of perception and memory.

Every person has one primary learning mode. Once you identify that mode, you can learn to maximize it and enhance your child's education.

1. **Visual Learners**

There are some students who have a visual learning style: "Show me and I'll understand." Visual learners benefit from diagrams, charts, pictures, films, and written directions. Notes, assignment logs, and to-do lists will be valuable to these students. Kinesthetic learners, however, can also benefit from many of these techniques.

2. **Auditory Learners**

It has been found that traditional teaching techniques are the most effective for auditory learners. Many teachers present information to their students in a lecture-style forum. Maintaining interest and attention can be achieved by regulating voice tone, inflection, and body language. In order for auditory learners to succeed, directions should be read aloud, speeches must be required, or information should be presented and requested verbally.

3. **Reading/Writing Learners**

Reading and writing are two of the best ways for students to learn. These students tend to have a strong affinity for written language. In addition to handouts and PowerPoint slide presentations in class, written assignments provide students with the opportunity to synthesize course content. Several information-rich sources on the internet are relatively text-heavy, so this modality is also suitable for conducting research online.

Students who are reading/writing-oriented should take copious notes during classroom lectures to help them process information and remember it more easily.

4. **Kinesthetic Learners**

Students excel through kinesthetic means: they touch, feel, and experience the material. Kindergartners enter kindergarten as kinesthetic and tactual learners, moving and touching everything as they learn. It is common for some students to become visual learners by the second or third grade. Late in their elementary school years, some students, primarily females, become auditory learners..
