Name: Estelo C. Galendez Jr. Course/Year/Set: BSIT-2E Subject: GEELEC1

Module 2 – Lesson 1

Activity:

Copy and paste pictures online to illustrate an untouched environment (BEFORE) and the same picture of that spot that has been developed or altered by humans (AFTER). Paste those photos in their respective boxes. See Figure 2.1 as an example below.

FIGURE 1.1 ENVIRONMENTAL DAMAGES BEFORE AND AFTER PHOTO

Before:

From the picture above, trees are plentiful and have not been damaged, and the land has not been modified yet.

After:

As we have seen in the picture, trees are being logged. It is because I think they wanted to build an infrastructure, so they cleaned the area by logging the trees and modifying the land's surface.

Analysis:

In the given example, there are changes happened in the same spot. If trees died because they were removed for the purpose of building homes for humans, who else lost their habitats in the process? What does this scenario mean to other living organisms?

- Obviously, the animals that were living there were the ones that were at a disadvantage. This scenario means that overexploitation of natural resources like trees just for the purpose of constructing a building will lead to the loss of habitat for animals.

Application:

How can humans promote economic development (continue building roads, houses, etc.) while protecting the environment? Suggest at least 3 possible environmental protection measures.

Humans can promote economic development while protecting the environment by limiting the use of non-renewable resources. We can continue to build roads, houses, etc. as long as we know how to counter the negative effects that are caused by them.

Promote public transportation: Encourage the development and use of public transportation systems, such as buses, trams, and subways, to reduce the number of private vehicles on the road. This can help lower greenhouse gas emissions and alleviate traffic congestion.

Implement green energy solutions: Transition to renewable energy sources like wind, solar, and hydroelectric power for energy generation. This reduces reliance on fossil fuels and lowers greenhouse gas emissions associated with electricity production.

Invest in waste reduction and recycling programs: Develop and promote recycling and waste reduction initiatives to minimize the environmental impact of landfills and incineration. This includes recycling programs for paper, plastic, glass, and electronic waste.

Assessment:

1. C
2. A
3. D
4. B
5. B
